Introduction

This document describes how to connect and set up your Fiery proServer and keep it in good working condition after installation.

The following topics are covered:

- Connecting the Fiery proServer
- Hardware components, including Fiery QuickTouch
- Starting, shutting down and rebooting the Fiery proServer
- Changing the language of Fiery proServer
- Updating the Fiery proServer software
- Starting the Fiery proServer software
- Backing up and restoring the Fiery proServer system
- Licensing the Fiery proServer software
- Using anti-virus software
- Troubleshooting
- Fiery proServer documentation and help

Note: The term Fiery proServer refers to both Fiery proServer Premium and Fiery proServer SE hardware. Different procedures are provided for each when necessary.

Connecting and starting the Fiery proServer

All required cables and components are provided in the Fiery proServer shipping box.

Keep the following guidelines in mind when making connections:

- Be sure to use the appropriate power cable for your regional outlet type.
- By factory default, the upper Ethernet port is configured for DHCP, which means that it can dynamically request IP addresses. Use the upper Ethernet port to connect the Fiery proServer to your company network.
- The lower Ethernet port is also configured for DHCP and can be used to connect to the inkjet printer, assuming that both the Fiery proServer and inkjet printer are on the company network.

Note: The procedures for connecting the Fiery proServer Premium and Fiery proServer SE are different. See [Connecting the network and the printer to the Fiery proServer Premium](#) on page 6 and [Connecting the network and the printer to the Fiery proServer SE](#) on page 6.

Connecting the network and the printer to the Fiery proServer SE

The Fiery proServer SE has two network connectors on the back panel. The upper network connector is used to connect the Fiery proServer SE to your network. The lower network connector is used to connect the Fiery proServer SE to the printer.

- Use the graphic to help you in connecting the Fiery proServer SE to the network and the printer.

1	USB 2.0 ports
2	Monitor port
3	USB 2.0 ports
4	USB 3.0 ports
5	Power port
6	Network connection
7	Printer connection
8	Power switch

Connecting the network and the printer to the Fiery proServer Premium

The Fiery proServer Premium has two network connectors on the back panel. The upper network connector is used to connect the Fiery proServer Premium to your network. The lower network connector is used to connect the Fiery proServer Premium to the printer.

- 1 Insert the network cable into the upper Ethernet connector on the back panel of the Fiery proServer Premium.
- 2 Insert the printer cable into the lower Ethernet connector on the back panel of the Fiery proServer Premium.

1	Power connector
2	Power switch
3	Type A USB2.0 ports
4	Type A USB3.0 ports
5	DVI port (monitor)
6	Network port
7	Command interface port (for straight-through Ethernet cable)

Fiery proServer SE front panel

The graphic displays the front and side panel of the Fiery proServer SE.

2 *USB 3.0 ports (x3)*

3 *Reset button (this is accessible only for a service technician)*

4 *Power button*

5 *DVD drive*

6 *DVD eject button*

Fiery Quick Touch

The Fiery Quick Touch LCD on the front of the Fiery proServer provides access to a number of functions.

You can do the following:

- Shut down, or reboot the Fiery proServer
- Restart the Fiery proServer
- Change the brightness setting of the LCD

By default, Fiery Quick Touch displays **Idle** after startup, which indicates that no jobs are currently being processed. To display the Fiery Quick Touch main menu, press the ellipsis icon (three dots) at the top right of the display.

Observe the following precautions when using Fiery Quick Touch:

- Avoid pressing the surface of the liquid crystal display (LCD).
Applying pressure to the LCD causes it to change color.
- Use a soft cloth moistened with lens cleaner to clean the surface of the LCD.
Other solvents, such as water, may damage the LCD.
- Handle the LCD with care.
If the LCD breaks and the liquid crystal inside leaks out, avoid contact. If you do come in contact with the liquid crystal, immediately wash it off your skin with soap and water

Fiery Quick Touch status messages and commands

Fiery QuickTouch displays status messages and commands.

Status messages

Fiery QuickTouch displays the following status messages:

Starting up	The Fiery proServer is starting.
Idle	The Fiery XF server is started, but is not processed jobs.
Busy	The Fiery XF server is processing jobs.
Fiery services are not responding.	The Fiery XF server is not started.

Commands

Fiery QuickTouch has four commands. To display the commands, press the ellipsis icon (three dots) at the top right of the display. You can select a command by pressing the corresponding icon on Fiery QuickTouch.

Shutdown system	Shuts down Fiery proServer.
Reboot system	Restarts Fiery proServer.
Restart system	Restarts the Fiery XF. The connection to the Fiery XF software is automatically interrupted when you select this command.
Brightness	Enables you to adjust the brightness of the Fiery QuickTouch LCD. You can also use this command to dim the display when it is inactive.

Starting, shutting down, and rebooting the Fiery proServer

This section describes how to start, shut down, and reboot the Fiery proServer when necessary.

Note: Always use the following procedures. Do not use the reset button on the side of the Fiery proServer to shut down or reboot the system.

Start the Fiery proServer

1 Set the power switch on the back of the Fiery proServer to the On (I) position.

2 Power on the Fiery proServer.

Press once and release the button to power on the system. The power supply automatically senses the correct voltage.

3 At the Admin logon on the monitor, enter **Fiery.1** in the password field, and then press Enter.

Type **Fiery.1** exactly. The password is case-sensitive; for example, **fiery.1** will not work.

4 Allow startup to proceed until the Fiery proServer desktop appears on the monitor, and Fiery QuickTouch displays Idle.

The Fiery proServer takes approximately two minutes to start up. If you are starting Fiery proServer for the first time, you are required to license the Fiery XF server as part of the installation procedure. For more information, see [Activating the Fiery XF software license](#) on page 17 .

By default, the Windows taskbar is hidden.

The taskbar contains:

- Fiery Server Control, a separate application starts and stops the Fiery XF server, manages licenses, and accesses updates.
- Fiery System Tools, a tool for changing the language of all Fiery proServer hardware and software components, and for backing up and restoring the Fiery proServer system.

5 To display the Windows taskbar, do one of the following:

- To display the taskbar momentarily, move the pointer to the bottom of the screen.
- To display the taskbar at all times, right-click the taskbar and then click Settings. On the Taskbar tab, set Lock the taskbar to on, and Automatically hide the taskbar in desktop mode to off.

6 To start the Fiery XF server, right-click Fiery Server Control and select Start Fiery Server.

7 To start Fiery Command WorkStation, right-click Fiery Server Control and select Start Fiery Command WorkStation, or double-click the Fiery Command WorkStation icon on the desktop.

Shut down the Fiery proServer

1 Verify that the Fiery proServer is not receiving, processing, or printing any files.

If the system has just finished processing, wait at least five seconds after the system reaches Idle before you proceed.

2 Exit the Fiery proServer software.

On the File menu, click Exit to close the client.

3 On the Fiery QuickTouch main menu, press Shutdown system.

Allow the system to shut down completely.

Reboot the Fiery proServer

If a USB flash drive is attached to the Fiery proServer, remove it before rebooting. Otherwise, the Fiery proServer will not reboot.

- 1 Verify that the Fiery proServer is not receiving, processing, or printing any files.

If the system has just finished processing, wait at least five seconds after the system reaches Idle before you proceed.

- 2 Exit the Fiery proServer.

On the File menu, click Exit to close the client.

- 3 On the Fiery QuickTouch main menu, press Reboot system.

Wait for the system to reboot and the login window to appear on the monitor.

- 4 Enter the Admin password, and then press Enter.

Fiery.1 is the default Admin password and is case-sensitive. If your administrator has changed the password, and the new password is lost, you must reset the Fiery proServer to its factory state. For more information, see <to come.

When you have logged on, the Fiery proServer desktop appears.

Changing the language of the Fiery proServer

When you first start the Fiery proServer, after logging in, you select the language for the system. You can change the system language at any time by using the procedure below.

Note: The language change takes up to 15 minutes to complete. When the language change is in progress, it cannot be aborted.

The language change is applied to the operating system and keyboard, Fiery Server Control, and the Fiery XF server.

- 1 In the Windows taskbar, start Fiery System Tools.
- 2 Click Change system language, and select a language from the drop-down list box.

If you change the language, you need to restart the system.

The Fiery XF software also has its own language setting which overrides the language setting made for the Fiery proServer. For more information, see [Changing the language of the Fiery XF software](#) on page 13.

Updating the software of the Fiery XF server

Check for software updates to make sure your software is up to date.

To update the software, the Fiery proServer must be connected to the Internet. It is essential to ensure that you have the latest version of the software installed on your computer. A notification appears at the bottom of the Fiery XF

server window when a free-of-charge update is available. The notification remains until you have updated your system.

- 1 Exit the Fiery XF server and Command WorkStation.
- 2 Click the Fiery Server Control icon in the taskbar, and click Fiery Online Updater. The Updater dialog box appears.
- 3 Click Next.
A dialog box with a list of currently available software updates appears. It indicates which update files are available and also gives information about file size and version number.
- 4 Select the check boxes of the updates you want to install, and click Next.
- 5 Follow the on-screen instructions to download the updated files, and to complete installation.
- 6 Restart your computer, if prompted to do so.
For more information, see *Fiery Command WorkStation Help*.

Start the Fiery XF server

The Fiery XF server starts automatically whenever you start the Fiery proServer. If you exit the Fiery XF server for any reason, you can restart it.

- 1 Right-click Fiery Server Control, and click Start Fiery Server.
- 2 Right-click Fiery Server Control and select Start Fiery Command WorkStation, or double-click the Fiery Command WorkStation icon on the desktop.
In Command WorkStation, you can view information on the the status of your Software Maintenance & Support Contract (SMSA) and other software licenses in Server Manager, accessed from the Server menu. In Server Manager, click the Server icon, then select License & Contract.

Changing the language of the Fiery XF software

You can change the language of Fiery XF software in Command WorkStation Preferences.

The Fiery proServer comes installed with Fiery XF software, which includes Command WorkStation.

- 1 In Command WorkStation, click Edit > Preferences.
- 2 Click Region.
- 3 Select a language.
- 4 Click OK.
- 5 Restart Command WorkStation.

Backing up and restoring the Fiery proServer system

A Fiery proServer system backup enables you to restore the Fiery proServer to an earlier state in case of a problem, without having to return it to its factory settings.

You can use Fiery System Tools for backing up and restoring system software. If necessary, you can reinstall system software from the system software DVDs.

It is recommended that you create a backup when you have set up the Fiery proServer system, and then backup approximately every three months.

Fiery System Tools

Fiery System Tools provides tools to manage the Fiery proServer system.

Fiery System Tools has the following menus:

Command	Description
Back up your system	Saves a backup of the hard disk drive to a data storage medium, such as a USB drive, an external hard disk, or a network location. You can also create a backup in a subfolder of the local hard disk.
View backup history	Displays the date and time of created backups.
Restore system from a previous backup	Deletes all the data on the hard disk drives, and returns the Fiery proServer embedded system to an earlier state from a backup.
Restore to factory defaults	Reinstalls the Fiery proServer embedded system from a hidden partition on the hard disk drive. This operation causes all system data to be lost.
Restore a backup made on a previous system	Restores an existing backup to a new embedded Fiery proServer system.
Create system recovery media	Saves a bootable copy of the system's recovery partition to a data storage medium, such as a USB drive, or an external hard disk. You can use a system recovery to return an embedded Fiery proServer to an earlier state—for example, after the hard disk has been replaced but no backup is available, or the backup exists as a network fileshare.
Change system language	Changes the language of the operating system and keyboard, Fiery XF Control, and Fiery XF.
Create network fileshare setup file	Allows you to set up a shared network folder with access credentials for backup and restore purposes.
Set up e-mail notification	Allows you to receive an e-mail notification when the installation, backup, or restore is complete, which can take more than an hour.

Back up Fiery proServer system

- 1 In the Windows taskbar, start Fiery System Tools.

- 2 Click **Back up your system**.
- 3 Select one of the following backup destinations:
 - USB flash drive
 - External HDD
 - Network share
 - Subfolder of the local hard disk

Note:

To create a backup of Fiery proServer Core, you require a USB flash drive or an external hard drive. The data storage medium must have a minimum of 16 GB storage space (32 GB is recommended), have no more than one partition, and be formatted to NTFS.

- 4 Select **Include Fiery job files in backup** (optional).
Be aware that job files can be backed up, but not the output files that reside in the **Export** folder due to their size.
- 5 If your system backup file will be created on a USB flash drive or an external HDD, plug the device into a USB port on the Fiery proServer.
- 6 Click **Next**.
- 7 Click **Restart**.
The backup process is complete when the system returns to Windows.

Restore the Fiery proServer

The Fiery proServer system is restored with all the settings, including system environments, that were current at the time the backup was created.

Any settings made after the backup was created are lost. The restore procedure may take up to one hour, depending on the backup medium used and the volume of job data.

- 1 Make sure that the system backup file is accessible from one of the following locations:
 - USB flash drive
 - External HDD
 - Network share
 - Local system
- 2 If your system backup file is stored on a USB flash drive or an external HDD, plug the device into a USB port on the Fiery proServer.
- 3 In the Windows taskbar, start **Fiery System Tools**.
- 4 Click **Restore system from a previous backup**.
- 5 Select the backup to restore on the replacement system and click **Next**.
If you created a backup in a network share, click **Search Network**. Type the network location and logon information, and then click **OK** to log on to the server. Then, select the backup that you want to restore.

- 6 Click Continue to confirm that you want to erase all the data on the hard disk drive.
- 7 Continue to follow the on-screen instructions.
At the end of the procedure, Windows starts automatically. You do not need to reactivate the license if the Fiery XF software was already licensed before the backup.

Return Fiery proServer to its factory state

You need to return the Fiery proServer to its factory state, for example, if the default password has been changed and the new password has been misplaced. The Fiery XF software license and all your client software settings, including system environments, are deleted from the hard disk drives.

- 1 In the Windows taskbar, start Fiery System Tools.
- 2 Click Restore to factory defaults.
- 3 Click Restart to confirm that you want to erase all the data on the hard disk drive and to start the restore procedure.
At the end of the procedure, Windows starts automatically. You need to reinstall the license for the Fiery XF software. For more information, see [Managing licenses](#) on page 17.

Reinstalling Fiery proServer Premium system software from DVDs

If necessary, you can reinstall system software from the DVDs, instead of Fiery System Tools.

Before reinstalling system software, you must make a note of your License Activation Code and deactivate the license. See [Managing licenses](#) on page 17.

All Fiery proServers are shipped with a Fiery System Tools icon preinstalled on the taskbar. This tool provides a method to back up and restore system settings, or to return your system to its factory state. If you have a Fiery proServer SE or Core, you must use Fiery System Tools, as the hardware does not come with a DVD drive and installation DVDs. To start Fiery System Tools, double-click the icon on the taskbar, and follow the on-screen instructions.

The steps described below are for the Fiery proServer Premium, and require you to insert System Software DVD 1.

Note: Reinstalling the Fiery proServer Premium system software can take up to one hour.

- 1 Do one of the following:
 - If the Fiery proServer Premium is running, exit Fiery XF. Insert the System Software 1 DVD and reboot the Fiery proServer Premium.
 - If the Fiery proServer Premium is frozen or unresponsive, hold down the power button on the front panel until the system powers off. Press the power button once to power on the system and immediately insert the System Software DVD 1 (Fiery XF server).

Wait for the system to boot from the DVD and for Windows to load the installation files. This takes a few minutes.

- 2** When requested, select a language from the drop-down list box.
This is the language used to lead you through the installation procedure.
- 3** When asked what you want to do, click **New Installation**.
- 4** Click **Continue** to confirm that you want to erase all the data on the hard disk drive.
- 5** Continue to follow the on-screen instructions. When requested, insert first the System Software DVD 2 (Win 10 OS DVD 1/2), then the System Software DVD 3 (Win 10 OS DVD 2/2), and finally User Software DVD 4 (Fiery Command WorkStation).
At the end of the procedure, Windows starts automatically. You must now select the system language and activate the Fiery XF license.

Activating the Fiery XF software license

On first time connection to Fiery XF software, you must activate the license.

Make sure you have your License Activation Code (LAC), which is shipped with your Fiery proServer. The LAC is required to activate the software. Store your LAC so that it is available for future reference, in case of deactivation. Select and copy it after or during activation and then paste it into a text document, store that on a network drectory, or on a USB flash drive.

The Fiery XF software comes pre-installed with Command WorkStation on the Fiery proServer. Different instructions will be provided, depending on whether the Fiery proServer is connected to the internet or not.

- 1** Start the Fiery proServer.
- 2** In the Fiery proServer Configuration window, click **Activate software**.
- 3** Select **Activate** if you have a LAC, and follow the on-screen instructions.
- 4** Click **Migrate** if you are upgrading from a legacy dongle-protected Fiery server and follow the on-screen instructions.

The LAC will be downloaded from within the application during the migration workflow.

You can always check the status of licenses or manage licenses in **Server Manager > Server > License/Contract**.

To open the license activation browser after first-time setup, open **Fiery Server Control** from the Windows taskbar and select **Manage Licenses**.

Managing licenses

You can activate or deactivate a product or a product option for this Fiery server at any time.

Make sure you have your License Activation Code (LAC) handy. At the time of first activation, be sure to store your LAC so that it is available for future reference, in case of deactivation. Select and copy it after or during activation and then paste it into a text document, store that on a network drectory, or on a USB flash drive.

- 1** In the taskbar: Right-click **Fiery Server Control**, and click **Manage Licenses**.

The License Activation window opens.

2 Do one of the following:

- To activate a product or a product option for this Fiery server: Click **Activate**.
- To deactivate a product or product option: Click **Deactivate**.

Note:

You can activate a deactivated license on a different Fiery server. Make a note of the LAC before you deactivate the license. If you forget, the LAC is also recorded on the History tab of the License Activation window.

3 Follow the on-screen instructions.

4 Restart the Fiery server.

Now watch the video [here](#).

You can display the contents of an activated license, by expanding the license name in the Product/Option column.

Anti-virus software

The Fiery proServer does not come with anti-virus software preinstalled.

In production environments in which files are regularly exchanged with customers, it is strongly recommended that you install an anti-virus program of your choice. When installing an anti-virus program, make sure that the following network ports are not blocked as they are needed for specific features of the Fiery XF software.

Port	Used for
4108	Epson Spectroproofer
8010, 8013	Bi-directional communication service
8020, 8022, 8030, 8032	Integration and connectivity between Fiery XF server and EFI printers
8051, 8052, 8053, 8054, 8061, 8062, 8063, 8064	Communication between Fiery XF server and APPE processes (up to four instances)
27000 to 27009, 60000	License management/EFI Cut Server
50005 to 50026	General communication between Fiery XF server and Fiery XF client
20020 to 20021 (UDP only)	Fiery XF server discovery

Troubleshooting Fiery proServer

The following sections describe the source of common problems that may occur with the Fiery proServer.

A number of suggestions to resolve these problems are provided.

Checking the Fiery proServer configuration

This section describes the quick checks that you can do to make sure that the problem is not caused by an incorrect Fiery proServer configuration.

Does the Fiery proServer start up normally?

If, during startup, you hear 4 beeps, followed by 3 beeps, followed by 1 beep, followed by 2 beeps, there may be a problem with the memory. Contact your authorized service/support center.

Is the Fiery Server Control icon green?

The Fiery Server Control icon is located in the Windows taskbar. A green arrow indicates that Fiery Server Control is running.

If the arrow is red, try the following:

- You may have not activated the license correctly. A dialog should appear asking you to enter your LAC.
- Verify that no unauthorized software is installed on the Fiery proServer.

Third-party applications are not supported and can cause system problems. Although anti-virus software is permitted on the Fiery proServer, you should run virus scans only when the Fiery proServer is in Idle mode (not processing or printing any jobs).

Is the connection to the printer correctly configured?

The connection to the printer may not be correctly configured.

Try the following:

- Use the Fiery XF server to send a test job to the printer.
- Restart the printer.

If the problem persists, you may need to test and service the printer. For more information, see the documentation that accompanies the printer.

- Verify that the problem is not caused by a particular print job or application.

Try printing a different job or using a different printing application.

Is the network functioning?

You may have issues with the network, or the Fiery proServer may not be properly connected to the network.

Verify the following:

- The Fiery proServer appears in the list of computers on the network.
If the Fiery proServer does not appear in the list of computers on the network, another device on the network may have been assigned the same Ethernet hardware address.
- The Fiery proServer DHCP setting matches the DHCP setting of the customer's network.
If DHCP error messages appear on the monitor, the Fiery proServer may be searching for a non-existent DHCP server. DHCP is enabled by default on the Fiery proServer, but the customer's network may not be using DHCP. In this case, you need to configure a static IP address for the Fiery proServer.
If the problem persists, check the interface connections. For more information, see [Checking interface connections](#) on page 21.

Is the setting for showing hidden files selected?

You must be able to access some files in the Program Data folder for certain troubleshooting purposes.

- 1 Move the mouse pointer to the lower-left corner of the screen to see the Windows icon.
- 2 Right-click the Windows icon, and then click Control Panel.
- 3 Set the Control Panel display to view by small icons.
- 4 Click File Explorer Options, and then click the View tab.
- 5 Under Advanced Settings, select Files and Folders > Hidden files and folders, and click Show hidden files, folders, and drives.
- 6 Clear Hide extensions for known file types.
- 7 Click OK to confirm the changes.

Is the JobFolder folder shared?

The JobFolder folder must be shared to allow access to hot folders.

- 1 On the C:\ drive, right-click the Jobs folder and click Properties.
- 2 On the Sharing tab, click Advanced Sharing.
- 3 Select Share this folder, and click Permissions.
- 4 Select Everyone, and set the permission level to Read and change. Then, click Apply.
- 5 Click OK to confirm the changes, and close all windows.

Is the Output folder shared?

The Export directory must be shared so that the printer has access to pull output files from the Fiery proServer. The procedure below describes how to enable sharing with the Output folder.

- 1 Right-click the Output folder and click Properties.
Depending on your model of Fiery proServer, the Output folder is located either on the D:\ or E:\ drive.
- 2 On the Sharing tab, click Advanced Sharing.
- 3 Select Share this folder, and click Permissions.
- 4 Select Everyone, and set the permission level to Read and change.
- 5 Then, click Apply.
- 6 Click OK to confirm the changes, and close all windows.

Checking interface connections

This section describes the quick checks that you can do to make sure that the problem is not caused by a loose connection at the back of the Fiery proServer.

Verify the following:

- All components and interface cables to the system are securely plugged into the correct ports on the back of the Fiery proServer. After verifying the connections, reboot the Fiery proServer.
For an illustration of the correct ports and connections at the back of the Fiery proServer, see [Connecting and starting the Fiery proServer](#) on page 5.
- The power cable is plugged into the power outlet, and the Fiery proServer is powered on.
For more information, see [Connecting and starting the Fiery proServer](#) on page 5. If the Fiery proServer does not start, try replacing the power cable with a new or tested cable.
- The upper LED next to the network port is on or blinking to indicate network activity.
If the upper LED is off, verify that the network cable is properly connected to the correct network port on the Fiery proServer and to the network device on the customer network. If the problem persists, try replacing the network cable with a new or tested cable.

Troubleshooting corrupted system software

If verifying the Fiery proServer configuration and connections do not correct the problem, the problem may be caused by corrupted system software.

To remedy the problem, restore the Fiery proServer system to an earlier state. See [Return Fiery proServer to its factory state](#) on page 16.

Downloading documentation

You can access and download all Fiery proServer documentation at any time.

The *Installation Guide* is provided printed in your accessory box and also online. The *Quick Start Guide* is provided printed in English in your accessory box and also online. The *Quick Start Guide* in other languages is provided online. All other documentation is provided online.

The Fiery proServer documentation set consists of the following:

- *Installation Guide* describes how to install the Fiery proServer and activate the Fiery XF license.
- *Quick Start Guide* is a step-by-step guide on how to set up and use the Fiery proServer with your EFI inkjet printer.
- *Upgrade Guide* describes how to upgrade the Fiery XF software on your Fiery proServer from a previous version.
- *User Guide* describes how to keep the Fiery proServer in good working condition after initial installation and setup.

- 1 Double-click the Adobe icon on the Fiery proServer desktop to open the Adobe website and download Adobe Reader.

You need Adobe Reader in order to access the Fiery proServer documentation, which is provided in PDF format.

- 2 Open the web browser of your choice.
- 3 To download the Fiery proServer *Installation Guide*, *Quick Start Guide*, *Upgrade Guide*, or *User Guide*, go to help.efi.com.
- 4 As needed, click the links for your product version and language, and download the latest documentation.

Fiery XF server online help

The Fiery XF server includes a comprehensive help system.

- The application help provides detailed information on how to set up and use each feature of the software. In Command WorkStation, select Help in the Help menu.
