Customer Release Notes

Fiery JobFlow Pro version 1.1

This document contains important information about this release. Be sure to provide this information to all users before proceeding with the installation.

What's new in version 1.1?

The Fiery JobFlow Pro version 1.1 release introduces the following features:

- **Users** - allows you to manage local users, roles, temporary passwords, and Drop Zone permissions.
- **Resource Manager** - allows you to upload, view, organize, and manage resource files such as Fiery Impose templates, FreeForm Create files, quality profiles, and QuickFix configurations used in workflows. Only administrators can access the **Resource Manager** tab.
- Fiery JobFlow Pro can be installed on Fiery servers with FS700 system software or later, running Windows 10 LTSC.
- The following nodes are introduced to the JobFlow Pro Editor workspace:
  - **fiery-override** - allows you to configure job properties before submitting tasks to the Fiery server, either by selecting options or assigning values automatically from workflow data. The node enables you to replace default settings, apply custom values, and ensure consistency across tasks, streamlining job setup, and reducing errors.
  - **sense-type** - determines the actual file type by analyzing the file content rather than the file extension. The node recognizes more than 200 formats to ensure files are accurately routed and processed, identifies misnamed files or files missing an extension, and verifies file formats before key workflow steps.
- Custom configuration files, such as `concurrency config`, `timeout config`, and other node configuration files, are preserved during updates and remain stored in the JobFlowProFolders\config folder on the configured drive.
- **Fiery Model Hub** - allows you to run advanced AI capabilities for print automation workflows by running AI models directly on your local hardware. Fiery Model Hub ensures that all job processing and sensitive data remain securely within your network, providing greater privacy, and control.

Supported browsers

Fiery JobFlow Pro version 1.1 is supported on the following browsers:

- Google Chrome
- Microsoft Edge

- Mozilla Firefox
- Safari

Fixed issue

High speed inkjet Fiery servers are not fully functional

A high speed inkjet Fiery server can connect to Fiery JobFlow Pro, but full functionality may not be supported.

Known issues

JobFlowProFolders is created on a connected USB flash drive

When installing Fiery JobFlow Pro on a computer with a USB flash drive connected, the installer may create JobFlowProFolders on the USB flash drive instead of the drive with the most available space.

AI assistant node limitations

The responses from nodes with AI features may vary and must be verified for accuracy before use in a workflow.

The convert-office node fails if Microsoft Office is not installed first

If you submit a job to Fiery JobFlow Pro and use a workflow with the convert-office node, the job will fail if Microsoft Office is not installed or was installed after starting the workflow.

As a workaround, restart Fiery JobFlow Pro.

Read-only PDF files cannot be processed

A processing error may occur when you submit a read-only PDF file to the workflow that uses the toolbox-profiles node in the workflow.

Fiery Monitor node limitations with Fiery API

In Fiery API version 5.1 or earlier, the Fiery Monitor node can connect to the Fiery server, but it does not receive job updates.

As a workaround, update the Fiery API on the Fiery server to version 5.2 or later.
